

The dangers of electromagnetic city pollution

By LYNN DEWING

Special to the Vernon Daily Courier

Jenna Short has seen an egg between two activated cell phones literally cook in one hour and seven minutes.

"It depends on the type of cell phones," she said. "The older ones don't have the compacted EMFs that the newer ones with cameras, active keyboards for text messaging and Internet have."

According to her technological devices produce Electromagnetic Fields, (or radio waves), which travel through our bodies.

"Take a microwave oven and how the waves go through the food to heat it. That's how the EMF radiation goes through your body. When more technology is compacted into such a small space (as newer cell phones) the signals have to be greater to reach the cell phone towers," she said.

Short became convinced of the damaging effect of EMFs on the human body by her mother's experience and that is also how she learned about BioPro Technology products, which she now sells. Her research uncovered recent studies on the subject from various parts of the world and books such as *The EMF Handbook* by Stephen Prata, *The Electrical Sensitivity Handbook* by Lucinda Grant and *Cell Phones in the Wireless Age* by Dr. George Carlo.

Joan Short, a busy Certified General Accountant, said: "In February 2005 I started recognizing health problems. I had low energy, I was not handling stress well, I was tired and I was waking up a lot at night. By October I was not thinking clearly most of the time. I had a full physical, but nothing was wrong."

Visits to a recommended naturopath revealed that her adrenals were burnt out from over work and stress. Pills to balance them helped, but Vega testing further showed that she was EMF-sensitive, something she had never heard of. After some research, she tested the house and office.

"I found out I was sleeping, eating and working in severe electro-pollution, so I rearranged everything. Immediately I was sleeping better and some energy and clarity of mind returned," said Joan.

Then an Ontario friend heard about BioPro and got her a Room Harmonizer for home and office. Great improvement followed.

In April 2006, when she was working 14 hours a day, seven days a week and fluctuating mentally and physically, she began wearing a BioLife pendant.

"Within two days the fluctuating stopped," she said. "On April 30th, tax due date and usually the lowest point of the year, I was back to an old energy level I hadn't felt for four years!"

Jenna and Joan Short are helping ward off electro-pollution.

Students run higher risk

■ Continued from A5

Knowing that everything at the molecular level is energy, BioPro uses a technology called Sympathetic Resonance to "entrain" an object with a new "energetic signature" or frequency.

According to co-founder Alfred Hanser, this is much like changing the colour of fibres by soaking them in dye. After this the object has the capacity to change the way the human body responds to the EMFs it is exposed to.

"Cells communicate with each other through electromagnetic impulses," he said. "The body is nothing but a collection of cells with energetic frequencies, collectively called the human biofield. When electro-polluted it becomes compromised, resulting in disruption of metabolic processes and hardening of cell membranes. The cell cannot then expel toxins or absorb nutrients effectively."

He and his company recommend a multi-faceted approach to this complex problem that he believes is reaching crisis proportions in our society.

BioPro sells a chip for attaching to cell phones, a Home Harmonizer which influences a 60 foot radius from where it is plugged in, a headset with a hollow air-tube that does not conduct EMFs to the head, a pendant for wearing, a card to place under food and a range of nutritional responses to electro-pollution.

They are also committed to working toward macro-level solutions and public awareness and recently launched the Safe Wireless campaign with the non-profit Science and Public Policy Institute.

Short said, "I realized how many cell phones are out there and how many EMFs are trapped in schools and big businesses who use the newest technology. Students are more at risk because their skulls are not as thick, so EMFs more easily enter the brain. I know an adult in Vernon who began using the cell-phone chip and told me his ear didn't get hot when he used his cell phone anymore."

Short is available to do house surveys with an EMF detection meter. Call her at 558-4997 or check out www.mybiopro.ca/Jenna38
